

TE Curve Verification Pipeline Directional Model Comparison

Feedforward Transmission Error Baseline

Styled PDF edition generated from the canonical Markdown analysis report for improved readability, section hierarchy, and table presentation.

Overview

This report is the reduced selected-model TE Curve Verification Pipeline offline comparison for one dataset and one direction. It includes only the active selected model-development candidates plus reduced baseline anchors.

Dataset And Split

- dataset config: `config/datasets/transmission_error_dataset.yaml` ;
- dataset root: `data\polished_dataset` ;
- comparison mode: `reduced_selected_model_matrix` ;
- candidate count: `9` ;
- held-out curve count before candidate filtering: `100` ;
- percentage-error denominator: `peak_to_peak_truth` ;
- this reduced report excludes `global` candidates by design;
- only candidates valid for this direction are evaluated.

Curve Evidence

Each selected candidate is shown with four deterministic held-out curves. The dark line is the measured TE curve and the blue line is the model prediction for the same operating condition.

Interpretation

Rows are ranked by mean percentage error within each source group and direction. Directional candidates are never evaluated on the opposite direction in this reduced report. `global` is paused for the active reduced pipeline and is not included in the candidate inventory. The `rcim_track1` forward reference banks use the opposite stored `h0` sign convention relative to the TE Curve Verification Pipeline reconstruction contract, so the TE Curve Verification Pipeline comparison applies the documented source-specific `h0` compatibility multiplier before curve reconstruction.

Open Gaps

- This remains an offline TE-curve comparison and does not replace the future online Table 9 compensation benchmark.
- The report uses the saved Python model artifacts from `models/` ; ONNX parity checks remain a separate deployment-readiness task.
