

CVP 1.4 Predicted Mean h0 Surface Diagnostic

Feedforward Transmission Error Baseline

Styled PDF edition generated from the canonical Markdown analysis report for improved readability, section hierarchy, and table presentation.

Overview

Predicted-mean versus measured- h_0 diagnostic over 39 selected candidates from the CVP 1.4 per-curve matrix.

Decision

- The next intervention should target predicted mean / offset-surface behavior, not measured h_0 magnitude alone.
- Median selected-candidate mean bias is -0.0001 deg and median mean absolute offset error is 0.0031 deg.
- Median predicted-mean versus measured- h_0 slope is 0.9769 ; 1 selected candidates deviate from unit slope by at least 0.50 .
- 1 selected candidates have absolute mean bias at least 0.005 deg .

Candidate Selection

Candidate	Reason
DT19_Bw	surface_leader_Bw
ELM19_Bw	largest_mean_offset
ELM19_Fw	strong_h0_error_overlap

Visual Diagnostics

Predicted mean versus measured h0

Signed offset error by speed and torque

Interpretation

The useful signal is model-side mean-surface behavior: candidates with large offset error generally show candidate-specific bias, compressed or shifted predicted-mean surfaces, or direction-dependent behavior. This supports planning an offset/mean head or calibration branch that is evaluated per `Fw`, `Bw`, and `global` surface, while keeping centered-shape metrics separate.
