

CVP 1.4 Mean-Offset Full-Matrix Audit

Feedforward Transmission Error Baseline

Styled PDF edition generated from the canonical Markdown analysis report for improved readability, section hierarchy, and table presentation.

Overview

This report extends the `TE Curve Verification Pipeline` mean-centered collage diagnostic to the full official direction-valid candidate matrix. It computes raw curve error, curve-bias / `DC` offset, centered-shape error, peak-to-peak amplitude error, harmonic amplitude error, and harmonic phase error after every candidate produces predictions through its normal causal input path.

This is an analysis-only diagnostic. It does not train models, alter the dataset structure, update registries, or make full-curve mean-centering a deployment-time correction.

- Run Instance: `2026-06-03-10-54-10__track2d_mean_offset_full_matrix_audit`
- Config Path:
`config\paper_reimplementation\rcim_ml_compensation\reference_family_vs_feedforward\full_track2_matrix_template.yaml`
- Output Directory: `output\validation_checks\track2d_mean_offset_full_matrix_audit\2026-06-03-10-54-10__track2d_mean_offset_full_matrix_audit`
- Candidate Count: `111`
- Evaluated Curve Count: `12416`
- Harmonic Orders: `1, 3, 39, 40, 78, 81, 156, 162, 240`

Method

- raw `MAE` and `RMSE` are computed on the normal prediction residual;
- offset is the absolute difference between predicted and measured curve means;
- centered metrics subtract each curve's own mean from truth and prediction separately after inference;
- amplitude error compares predicted and measured peak-to-peak TE;
- harmonic amplitude and phase diagnostics are computed on selected sparse `RCIM` harmonic orders;
- condition summaries stratify by direction, speed, torque, and oil temperature.

Diagnostic Label Counts

Label	Candidate Count
shape	3
mixed:shape+amp	10
mixed:shape+amp+phase	3
mixed:shape+amp+phase+regime	2
mixed:shape+phase	4
mixed:shape+phase+regime	1
mixed:offset+amp	3
mixed:offset+amp+phase	7
mixed:offset+regime	26
mixed:offset+phase	15
mixed:offset+phase+regime	1
offset	36

CVP 1.4 Diagnostic Ranking

Rank	Candidate	Surface	Raw MAE	Centered MAE	Offset	Gain [%]	Label
1	rcim_retuned_GBM19_Fw	Fw	0.001089	0.000832	0.000634	21.8	shape

37	SVM19_Fw	Fw	0.003236	0.001175	0.002894	61.0	offset

Interpretation

The ranking is a diagnostic ordering, not a promotion rule. Offset-limited candidates need a causal offset-calibration or offset-aware loss strategy. Centered-shape-limited candidates need waveform-shape, derivative, harmonic amplitude, or phase improvements before retraining should be expanded.

The next training decision should keep `Fw`, `Bw`, and `global` surfaces in parallel. A forward leader does not close the backward or global branch, and a backward leader does not close the forward or global branch.

Runtime Input Boundary

All full-curve operations are post-prediction diagnostics. Candidate models still consume only current point-level state, an explicitly supported short causal history, or causal derived features. The audit does not use future TE samples as model inputs.
