

RCIM Model-Bank Reproduction Remaining Yellow-Cell Interrupted SVM Partial Closeout Campaign Results Report

Feedforward Transmission Error Baseline

Styled PDF edition generated from the canonical Markdown analysis report for improved readability, section hierarchy, and table presentation.

Overview

This report closes the synchronized local subset of the interrupted remaining-yellow-cell exact-paper bundle prepared in:

- `doc/reports/campaign_plans/track_1/exact_paper/2026-04-22-01-40-43_track1_remaining_yellow_cell_multi_family_campaign_bundle_plan_report.md`

The local workstation crashed while the remote `SVM` branch was still running. The remote process continued autonomously for an extended period, was later stopped manually, and the produced artifacts were then synchronized back into the local repository with the dedicated manual recovery helper. This is therefore an interrupted partial closeout, not a full closeout of the six-family overnight bundle.

- synchronized family scope: `SVM` only
- expected `SVM` queue size: `180`
- synchronized validation directories: `81`
- synchronized distinct run names: `80`
- synchronized per-run reports: `79`
- synchronized campaign logs: `80`
- completed report-backed runs: `79`
- known duplicate retry groups: `1`
- interrupted tail runs without final report: `1`

Manual Sync Outcome

- local sync helper:
`scripts/campaigns/track1/exact_paper/sync_track1_interrupted_remaining_yellow_cell_campaign_artifacts.ps1`
- sync staging root:
`.temp/manual_sync_track1_svm/2026-04-24-12-30-27/`
- synchronized campaign output root:
`output/training_campaigns/track1/exact_paper/forward/remaining_yellow_cells/svm/track1_svm_remaining_yellow_cell_campaign_2026_04_22_01_40_43/` The manual sync recovered the interrupted SVM branch cleanly enough for a formal partial closeout:
- the SVM campaign log surface is present locally;
- the completed exact-paper validation directories are present locally;
- the completed per-run Markdown validation reports are present locally;
- the batch tail can be classified precisely from the synchronized logs and artifact shapes.

Run Inventory

Completed Report-Backed Runs

- 79 synchronized run instances reached the normal exact-paper reporting stage and expose:
 - `validation_summary.yaml`
 - `paper_family_model_bank.pkl`
 - per-run Markdown validation reportThe completed subset covers:
- A40 attempts 01-60
- A240 attempts 01-19

Duplicate Early Retry

The synchronized validation surface contains one known duplicate retry group:

- `track1_svm_amplitude_40_yellow_cell_attempt_01_campaign_run`
The earlier instance:
 - `2026-04-22-01-51-11__track1_svm_amplitude_40_yellow_cell_attempt_01_campaign_run`
is the pre-alias-fix remote start and contains only:
 - `run_metadata.yaml`
 - `training_config.yaml`
 - The accepted rerun instance:
 - `2026-04-22-09-14-36__track1_svm_amplitude_40_yellow_cell_attempt_01_campaign_run`
is the valid post-fix branch member and has the normal campaign log plus full reported output shape.

Interrupted Tail

The final synchronized `svm` tail member is:

- `080_track1_svm_amplitude_240_yellow_cell_attempt_20`

Its validation directory:

- `2026-04-24-07-20-37__track1_svm_amplitude_240_yellow_cell_attempt_20_campaign_run`

contains only:

- `run_metadata.yaml`
- `training_config.yaml`

It does not contain:

- `validation_summary.yaml`
- `paper_family_model_bank.pkl`
- final Markdown validation report

The corresponding campaign log ends with a non-zero `conda run` failure from the exact-paper validation entrypoint, so this tail member must be classified as interrupted and not as a completed scientific result.

Candidate Scientific Gains

The synchronized completed subset materially improved the two `svm` amplitude-side yellow targets that were actually executed before the stop.

Harmonic 40

Current accepted canonical baseline

- accepted MAE : `8.20e-05`
- accepted RMSE : `9.63e-05`
- current accepted source run:

`2026-04-10-19-10-37__exact_full_bank_strict_reference_post_hgbm_fix_strict_repro` Best synchronized candidates:

Candidate	Run Instance	MAE	RMSE	Notes
Best MAE	<code>2026-04-22-09-14-50__track1_svm_amplitude_40_yellow_cell_attempt_02_campaign_run</code>	<code>7.20078e-05</code>	<code>9.22599e-05</code>	beats current baseline on both metrics
Best RMSE	<code>2026-04-22-09-19-50__track1_svm_amplitude_40_yellow_cell_attempt_23_campaign_run</code>	<code>7.56487e-05</code>	<code>9.04386e-05</code>	beats current baseline on both metrics

Harmonic 240

Current accepted canonical baseline

- accepted MAE : 2.52e-04
- accepted RMSE : 4.86e-04
- current accepted source run:

2026-04-14-17-31-04__track1_svm_amplitude_repair_seed23_campaign_run Best synchronized candidates:

Candidate	Run Instance	MAE	RMSE	Notes
Best MAE	2026-04-23-12-12-12__track1_svm_amplitude_240_yellow_cell_attempr_12_campaign_run	2.49252e-04	4.62395e-04	beats current baseline on both metrics
Best RMSE	2026-04-22-14-43-54__track1_svm_amplitude_240_yellow_cell_attempr_03_campaign_run	2.80127e-04	4.04452e-04	improves RMSE strongly but regresses MAE against the current accepted baseline

Promotion Decision

This partial closeout intentionally stops before any benchmark or reference archive promotion.

The synchronized SVM branch clearly produced numerically stronger candidates for A40 and A240 , but the batch does not yet satisfy the promotion requirements for a clean canonical benchmark refresh because:

- the SVM phase 162 yellow target was never reached;
- the interrupted tail means the branch did not complete the intended SVM sub-campaign;
- the completed candidate runs did not produce the normal promoted reference export surface expected by the existing SVM archive bookkeeping;
- for A40 , the best MAE and best RMSE come from different attempts, so winner promotion should be decided in one explicit follow-up promotion step instead of being coupled implicitly to this interrupted batch closeout. Repository consequence for this closeout:
- campaign state: close the interrupted bundle bookkeeping;
- benchmark state: unchanged in this step;
- SVM reference archive state: unchanged in this step;
- candidate gains: preserved and documented for the next explicit promotion or follow-up wave.

Remaining Open Scope

The interrupted overnight bundle still has no synchronized executed artifacts for:

- SVM phase 162
- MLP
- ET
- ERT
- HGBM
- XGBM

Therefore the six-family overnight bundle remains scientifically incomplete and this report must be read as SVM-only partial closeout .

Next Step

This interrupted partial closeout completes the artifact recovery and bookkeeping phase needed to release the campaign protection lock.

The next repository step can now move to the deferred post-closeout workflow documented in:

- `doc/technical/2026-04/2026-04-23/2026-04-23-23-15-55_post_closeout_forward_asset_root_migration_workflow.md`

Any later decision to promote the `SVM A40` and `SVM A240` candidate gains should be handled as a separate explicit promotion step after that migration or in a dedicated `SVM` follow-up closeout.
